iOS:

Create weather forecast iOS application.

The user must be able to enter the city name. For chosen city forecast data should be presented on one view controller, with current forecast as main content and horizontal scrolling content for next 5 days weather forecast.

For data, you can use https://openweathermap.org free plan (up to 60 calls per minute). Needed APIs are:

- current forecast - https://openweathermap.org/current
- 5 days forecast - https://openweathermap.org/forecast5

Although visual representation is not required a nice look and feel is considered as a bonus.
